NyAlternate names: embryogenic cell protein 63; phosphotyrosine protein
C; Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 11-Apr-1997 #sequence_revision 09-May-1997 #text_change 21-Jul-2000
C;Accession: JC6171 # F.; Komeda, Y.; Harada, H.; Kamada, H.
R;Yang, H.; Saltou, T.; Komeda, Y.; Harada, H.; Kamada, H.
A;Ritle: Arabidopsis thaliana ECP63 encoding a LEA protein is located in chromosome 4.
A;Reference number: JC6171; MUID:97169149

                                                                                                                                                                                             light chains. It is useful for binding, separating (purifying) and identifying immunoglobulin and for removing immunoglobulin molecules from serum. Hybrid proteins of the L protein can bind all human immunoglobulin classes and many immunoglobulins from other species. They are highly soluble and retain their binding activity at high without loss of activity.

It is useful for binding, separating (purifying) and identifying immunoglobulin and for removing immunoglobulin molecules from serum. This is the coding sequence of one hybrid protein of the L protein. The hybrid proteins can bind all human immunoglobulin classes and many immunoglobulins from other species. They are highly soluble and retain their binding activity at high without loss of activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for expressing and isolating a recombinant protein in a plant. The method comprising expressing a recombinant protein and a callulose fusion protein including the recombinant protein and a callulose binding peptide fused to it, where the fusion protein is compartmentalised and sequestered within plant cells, plant derived tissue or cultured plant cells. The method is useful for obtaining large quantities of the recombinant proteins and protein products in a simple and cost-effective manner. Recombinant proteins may be used commercially, such as in the food processing industry, e.g. glucoamylases and glucose such as in the food processing industry, e.g. glucoamylases and jlucose isomerases are used for converting starch to high fructose corn syrup, proteinases for the hydrolysis of high molecular weight proteins and in manufacturing leather or alcoholic beverages, pectinesterases for pectin hydrolysis in food industry, lipases for cleaving expert linkage in triglycerides, and for effluent treatment. The recombinant proteins may further be used to produce protein antibiotics, which can be used in triglycerides, and for effluent treatment. The recombinant proteins may further be used to produce animal feed enzymes. The present sequence represents a fusion protein of the invention, and comprises a fusion of a cell signal peptide, protein L, CBD cex, and an endoplasmic reticulum retaining peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;
invention also describes antibody-binding proteins (I) that comprise a combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) class I k(k) molecule; an antibody-binding site of proteins A, G, L or LG, and the transmembrane domain of PDGFR (platelet-derived growth factor receptor) or CD52. The method is used to select MAD with specificity for particular antigens. MAD can be selected without separate culture of hybridomas, and selection can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex mixtures of hybridomas can be used for selection, reducing the time and cost involved in MAD selection. This sequence represents the protein G contained in the expression vector pSEXILL4 which contains the protein G, Neo-R and the bla protein described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                           L comprise repeated sequences from protein L which bind immunoglobulin kappa light chains. They can be used in protein analysis, purification procedures and other blochemical processes e. g. ELISA. The synthetic molecules are of particular advantage if they are free of regions in protein L which exhibit albumin and cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ETPETDSEEEVTIKANLIFANGSTQTAEFKGTFEKATSEAYAYADTLKKDNGEYTVDVAD 69

                                                                                                                                                                                                                                                                                                                         Protein L forms a complex with immunoglobulin Kappa light chain. Purified protein can be used as a reagent for immobilising antibodies e.g. on columns, in diagnostic tests and in assays. may also be used in the production of pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide; immunoglobulin; binding; analysis; purification; ELISA; enzyme linked immunoabsorbant assay.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ĥ
                                                                                                                                                                                                                                                       This protein comprises growth factor TLHL, where L is the immunoglobulin binding entity from Peptostreptococcus magnus, H is residues 42-62 of hen eagy lysozyme, and T represents the variable kappa light chain (see AAM91483) from human myeloma protein LEN.

Was expressed in E. coli DH10B cells utilising a DNA construct (see AAP91898) produced from LHL (see AAM91986), kappa (see AAM91990) and synthetic linker oligonucleotides, and was purified from total bacterial lysate via a strep-tag. The linker contains a cleavage is the for tobacco etch virus (TEV) protease. TLHL was designed so that the kappa portion of the protein is cleaved by TEV protease into 'T' and 'LHL' moieties. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen is fused to a B cell surface molecule binding protein for the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). LHL crosslinks with surface immunoglobulin on B cells. This induces be cell activation and blast formation. Internalisation and processing of LHL leads to the presentation of the H peptide signals the child contains and contains and undergo antibody class switching activated B cell intogralidation and undergo antibody class switching activated B cell intogralidation and undergo antibody class switching
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Growth factor precursor; B-cell surface; T cell surface; CAb; hepatitis;

The invention relates to a growth factor precursor that comprises B-cell surface binding part, antibody (CAb); and a peptide comprising heavy and light challed antibody (CAb); and a peptide comprising heavy and light chalms of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific CAb, and to generate CAb from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAb can be directed against, e.g. tumour necrosis factor (treatment of rheumatoid arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzheimer's disease or myeloman) or IGE (treatment of allergies such as asthma). CAD may also be used for drug detoxification, corresponding nucleic acid in a viral or other gene therapy vector. The provet factor or inflammatory diseases and to eliminate environmental or industrial pollutants, such as plastics and perroleum. Particularly the growth factor precursors are produced by delivering the prosent sequence represents the amino acid sequence of TLHL. The LHL is a growth factor comprising H flanked by two L molecules where L is a B cell surface molecule binding portion from protein L of P. magnus; H is a T cell surface molecule binding portion from her egg lysosyme (HEL). TLHL is betting the present sequence to N terminus region.

This polypeptide comprises growth factor LHL-omp, where L is the immunoglobulin binding entity from Peptostreptococcus magnus and H is residues 42-62 of hen egg lysozyme. It was generated from LHL.seq (see AAM32481) such that the E. coli ompA signal sequence (generated by purifylng LHL.seq from whole bacterial host cells) was eliminated. The N-terminal omp peptide found in LHL (see AAW32479), LHL.seq (see AAW32481) and TLHL (see AAW32482) induces multimerisation as demonstrated by a potentiation of biological activity as compared to recombinant LHL-omp. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). The observation that omp induces multimerisation allows the design of simpler molecules with the same desired biological function as consistent of the process can have diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New catalytic antibody precursors · comprising a B-cell surface molecule binding portion which can induce B-cell mitogenesis
                                                                                                                                                        Catalytic antibody; growth factor; B-cell mitogenesis; LHL-omp;
                                                                                                                        Growth factor LHL-omp (catalytic antibody precursor).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treutlein HR;

```
The invention relates to a growth factor precursor that comprises B-cell surface binding part, a cell surface binding part, antigen cleavable by a catalytic antibody (CAD); and a peptide comprising heavy and light chains of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific CAD, and to generate CAD from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAD can be directed against, e.g. tumour necrosis factor (treatment of rheumatoid arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzheimer's disease or myeloma) or IGE (treatment of alleques stafma). CAD may also be used for drug detoxification, to treat autoimmune or inflammatory diseases and to eliminate environmental or industrial pollutants, such as plastics and petroleum. Particularly the growth factor precursors are produced by delivering the corresponding nucleic acid in a viral or other apene therapy vector. The present sequence represents the amino acid sequence of the LHL growth factor carrying an omph signal peptide (LHL.omp). L is a B cell surface molecule binding portion from her egg lysosyme (HEL). LHL is a growth factor comprising H flanked by two L molecules.
                                                                                                                                                                                                                                                                                                                                                             Growth factor precursor; B-cell surface; T cell surface; CAb; hepatitic catalytic antibody; immunoglobulin; tumour necrosis factor; influenza; rheumatoid arthritis; toxic shock syndrome; viral docking receptor; human immune virus; tumour-specific antique; amyloid plaque; myeloma; Alzheimer's disease; IGB; allergy; asthma; drug detoxification; autoimmune; inflammatory disease; gene therapy; protein L; P. magnus;

It is a modified form of LHL (see AAW32479) having an N-terminal FLAG epitope (see AAW32484) and a C-terminal strep-tag (see AAW32485) that facilitates purification. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen is fused to a B cell surface molecule binding protein for

```
The invention relates to a growth factor precursor that comprises B-cell surface binding part, T cell surface binding part, antigen cleavable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Growth factor precursor, B-cell surface; T cell surface; CAb; hepatitis; catalytic antibody; immunoglobulin; tumour necrosis factor; influenza; rheumatoid arthritis; toxic shock syndrome; viral docking receptor; human immune virus; tumour-specific antigen; amyloid plaque; myeloma; Alzheimer's disease; IGB; allergy; asthma; drug detoxification; autoimmune; inflammatory disease; gene therapy; protein L; P. magnus; hen egg lysosyme; HEL; LHL; LHL.seq.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). LHL.seq has the same biological activity as LHL, which crosslinks with surface immunoglobulin on B cells. This induces B cell activation and blast formation. Internalisation and processing of LHL leads to the presentation of the H peptide on MHC II. T cell recognition of MHC II with the H peptide signals the activated B cell to proliferate and undergo antibody class switching and secretion. The catalytic therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ------PKEEVTIKANLIYADGKTQTAEFKGTFEEA 117

by a catalytic antibody (CAb); and a peptide comprising heavy and light chains of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its traget. The growth factor precursors are used to select B cells that produce Ag-specific CAb, and to generate CAb from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAb can be directed against, e.g. tumour necrosis factor (treatment of rheumatoid arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, plaque (treatment of Alzheimer's disease or myeloma) or IGE (treatment of plaque (treatment of Alzheimer's disease or myeloma) or IGE (treatment of corresponding nor inflammatory disease and to eliminate convironmental or inflammatory diseases and to eliminate convironmental or inflammatory diseases and to eliminate convironmental or inflammatory diseases and to eliminate corresponding nucleic acid in a viral or other gene therapy vector. The present sequence represents the amino acid sequence of the LHL growth factor acriving a N-terminal FLAG epitope and a C-terminal strep tag. I is a B cell surface molecule binding portion from protein Loft of Pysosyme (HEL). LHL is a growth factor comprising H flanked by two L

This polypeptide comprises CATAB-TEV, a synthetic growth factor composed of: (a) TLHL (see AAW91589), where L is the immunoglobulin binding entity of Peptostreptococcus magnus, H is residues 42-62 of hen egg lysozyme, and T represents the variable kappa light chain (see AAW32483) from human myeloma protein LEN; and (b) an additional, C-terminal kappa protein, the elements of CATAB-TEV being joined by linkers containing recognition sites for tobacco etch virus (TEV) protease. CATAB-TEV was designed so that the kappa portions of the protein are removed by TEV protease to release 'T' and 'LHL' comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen is fused to a B cell surface molecule binding protein for the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). LHL (see AAW32479) crosslinks with surface immunoglobulin on B cells. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Growth factor precursor; B-cell surface; T cell surface; CAb; hepatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   induces B cell activation and blast formation. Internalisation and processing of LHL leads to the presentation of the H peptide on MHC II. T cell recognition of MHC II with the H peptide signals the activated B cell to proliferate and undergo antibody class switching and secretion. The catalytic antibodies generated by the process can have diagnostic and therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20; Gaps

The invention relates to a growth factor precursor that comprises B-cell surface binding part, antigen cleavable by a catalytic antibody (CAB); and a peptide comprising heavy and light chains of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific CAB, and to generate CAB from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAB can be directed against, e.g. tumour necrosis factor (treatment of rheumatonia arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzhaimer's disease or myeloma) or IGE (treatment of plaque (treatment of Alzhaimer's disease or myeloma) or IGE (treatment of alleryies such as asthma). CAB may also be used for drug detoxification, to treat autoimmune or inflammatory diseases and to eliminate environmental or industrial pollutants, such as plastics and petroleum. Particularly the growth factor precursors are produced by delivering the corresponding nucleic acid in a viral or other gene therapy vector. The particularly the growth factor precursors are produced by delivering the is assembled from Till and kappa by PCR. The LHL is a growth factor comprising H flanked by two L molecules where L is a B cell surface molecule binding portion from hen egg lysosyme (HEL). TLHL is LHL linked to kappa chain via TBY (tobacco etch virus) sensitive

"Characterization of the Bacilius anthracis S-layer: cloning and
sequencing of the structural gene.";
J. Bacteriol. 177:614-620(1995).
-!- FUNCTION: THE S-LAYER IS A PARACRYSTALLINE MONO-LAYERED ASSEMBLY
OF PROTEINS WHICH COAT THE SUPERCE OF BACTERIA.
-!- SUBCELLULAR LOCATION: Cell wall.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   YADGKTQ---TAEFKGTFEEATAEAYRY-ADALKKDNGEYTVDVADKGYTLNIKFAGKE-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nerve levels are high early in development but decrease during postnatal development and are low in adults. In dorsal root gangila levels remain high throughout development. In dorsal root INDUCTION: By nerve growth factor.

DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

PTM: LC1 is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by protecolytic processing. It is free to associate with of MAPIB (By similarity).
